## AMENDMENT(S) TO THE CLAIMS

1-36 (canceled)

37. (currently amended) A method for the modular production of coverings of different categories for use in one of paper machines, paperboard machines and tissue machines, said method comprising the steps of:

prefabricating a construction kit of web-shaped material layers, said web-shaped material layers of said construction kit being selectively combinable in a plurality of different combinations to form the coverings of the different categories, the different categories being a forming mesh, a press felt, and a dryer fabric;

selecting a <u>first</u> plurality of said web-shaped material layers from said construction kit depending on a category <u>of the different categories</u> and operating <u>conditions</u> of <u>the a</u> covering to be produced <u>of the coverings</u>;

stacking said <u>first plurality of</u> web-shaped material layers atop one another; and joining said <u>first plurality of</u> web-shaped material layers to one another at least in sections, two-dimensionally, and in a manner that prevents said web-shaped material layers from being detached.

38. (currently amended) The method according to claim 37, wherein said stacking of said first plurality of web-shaped material layers comprises stacking them in an order which depends on the said category and the said operating conditions of the said covering to be produced.

- 39. (currently amended) The method according to claim 37, wherein said joining of said <u>first plurality of</u> web-shaped material layers comprises joining at least two <u>said</u> web-shaped material layers together chemically.
- 40. (currently amended) The method according to claim 39, wherein said joining of at least two <u>said</u> web-shaped material layers together chemically is effected by an interface-active bond.
- 41. (previously presented) The method according to claim 40, wherein said interfaceactive bond is effected by one of vulcanizing, welding and melting.
- 42. (currently amended) The method according to claim 39, wherein said joining of at least two said web-shaped material layers together chemically is effected by adding a bonding medium.
- 43. (previously presented) The method according to claim 42, wherein said bonding medium is an adhesive.
- 44. (currently amended) The method according to claim 42, wherein said bonding medium forms a material layer which is arranged between said joined ones of said web-shaped material layers.

- 45. (currently amended) The method according to claim 44, wherein said bonding medium forms a foamed material layer between said joined <u>ones of said web-shaped</u> material layers.
- 46. (currently amended) The method according to claim 37, wherein said joining of said first plurality of web-shaped material layers comprises joining at least two said web-shaped material layers together mechanically.
- 47. (currently amended) The method according to claim 46, wherein said joining of at least two said web-shaped material layers together mechanically is effected by pressing.
- 48. (currently amended) The method according to claim 37, wherein said joining of said <u>first plurality of</u> web-shaped material layers comprises joining at least two <u>said</u> web-shaped material layers together by a textile joining method.
- 49. (previously presented) The method according to claim 48, wherein said textile joining method is effected by one of sewing and pinning.
- 50. (currently amended) A <u>system for forming a covering for use in one of paper</u> machines, paperboard machines and tissue machines, said <u>covering system</u> comprising:

a construction kit including a plurality of prefabricated web-shaped material layers for constructing the covering, said prefabricated web-shaped material layers of said construction kit

being selectively combinable in a plurality of different combinations to form a plurality of the covering of different categories, said different categories being a forming mesh, a press felt, and a dryer fabric, each said web shaped material layer being configured dependent upon a category and operating conditions of the covering a first plurality of said prefabricated web-shaped material layers from said construction kit being selectable depending on a category of the different categories and operating conditions of the covering to be produced of said plurality of coverings, said first plurality of prefabricated web-shaped material layers being stacked atop one another and joined to one another at least in sections, two-dimensionally, and in a manner that prevents said first plurality of prefabricated web-shaped material layers from being detached from one another.

- 51. (currently amended) The <u>covering system</u> according to claim 50, wherein said <u>prefabricated</u> web-shaped material layers have a stacking order that is dependent upon the <u>said</u> category and the <u>said</u> operating conditions of the covering to be produced.
- 52. (currently amended) The <u>covering system</u> according to claim 50, wherein said <u>prefabricated</u> web-shaped material layers fulfill specific functions.
- 53. (currently amended) The covering system according to claim 50, wherein said prefabricated web-shaped material layers are joined to one another in sections via a bonding medium that fulfills specific functions one of on its own and in combination with at least one of said prefabricated web-shaped material layers.

- 54. (currently amended) The <u>covering system</u> according to claim 50, wherein the construction kit of <u>said</u> prefabricated web-shaped material layers comprises at least one material layer influencing the surface of a fibrous web and at least one wear-stable material layer.
- 55. (currently amended) The <u>covering system</u> according to claim 54, wherein said material layer influencing the surface of a fibrous web is one of a textile areal structure and a non-textile areal structure.
- 56. (currently amended) The <u>covering system</u> according to claim 54, wherein said wear-stable material layer is one of a textile areal structure and a non-textile areal structure.
- 57. (currently amended) The eovering system according to claim 50, wherein the construction kit of said prefabricated web-shaped material layers comprises at least one dimension-stable material layer.
- 58. (currently amended) The <u>covering system</u> according to claim 57, wherein said dimension-stable material layer is one of a textile areal structure and a non-textile areal structure.
- 59. (currently amended) The <u>covering system</u> according to claim 50, wherein said construction kit of <u>said</u> prefabricated web-shaped material layers comprises at least one material layer influencing the liquid adsorption capacity.

- 60. (currently amended) The covering system according to claim 59, wherein said material layer influencing the liquid adsorption capacity has one of a high liquid adsorption capacity and a low liquid adsorption capacity.
- 61. (currently amended) The <u>covering system</u> according to claim 60, wherein said material layer with a high liquid adsorption capacity is one of a textile areal structure and a non-textile areal structure.
- 62. (currently amended) The eovering system according to claim 50, wherein said construction kit of said prefabricated web-shaped material layers comprises at least one anti-rewetting material layer.
- 63. (currently amended) The <u>covering system</u> according to claim 62, wherein said antirewetting material layer is one of a textile areal structure and a non-textile areal structure.
- 64. (currently amended) The eovering system according to claim 50 63, wherein said textile areal structure is one of a weave structure, a fleece, a thread plaiting, and a warp knitting.
- 65. (currently amended) The <del>covering</del> <u>system</u> according to claim <u>50</u> <u>63</u>, wherein said non-textile areal structure is one of:

at least one of a structured film and a penetrated film;

at least one of a structured membrane and a penetrated membrane; and

a foamed layer.

- 66. (currently amended) The <u>covering system</u> according to claim 65, wherein said film is at least one of extruded and rolled.
- 67. (currently amended) The eovering system according to claim 65, wherein said foamed layer has a defined pore size.
- 68. (currently amended) The eovering system according to claim 65, wherein said foamed layer has a plurality of defined pore sizes.
- 69. (currently amended) The <u>covering system</u> according to claim 68, wherein said foamed layer has a defined pore size in a transverse profile.
- 70. (currently amended) The <u>covering system</u> according to claim 50, wherein said <u>prefabricated</u> web-shaped material layers are joined to one another with at least one of a chemical and a mechanical bond.
- 71. (currently amended) The <u>covering system</u> according to claim 70, wherein said <u>prefabricated</u> web-shaped material layers are joined to one another by different bonding methods depending on the category, the operating conditions, and the material layers to be joined together.

72. (currently amended) The eovering system according to claim 71, wherein said prefabricated web-shaped material layers are mutually offset in one of a machine direction and a transverse machine direction and joined together, two-dimensionally, in sections so that the covering forms two end areas which complement each other in form and function and can be joined together.
